The Rental Unit Energy Efficiency Standards, effective January 1, 1985, require that rental units must conform with energy efficiency standards before ownership of the property can be transferred. Specific types of rental dwelling units not affected by the law are detailed in Ch. ILHR 67. Each conservation measure given in the rules has been chosen on the basis of a 5 year payback*. This means that the value of the money saved within 5 years due to the measure, will offset the installed cost of the measure. If an owner can document that a specific conservation measure on his/her building will take more than 5 years to pay back, DILHR will issue an exemption of the rules for that measure.

Applications for exemptions must be made on this form. ONLY ONE EXEMPTION MAY BE REQUESTED ON EACH FORM. The worksheet within this application estimates the energy saved from the envelope measures required by Chp. 67.05. Other non-envelope cost payback calculations may be approved by the Department. The final acceptance of cost payback shall be made by the Department.

TO APPLY FOR AN EXEMPTION Each request for an exemption must include:

1. A Completed Application (pages 1 and 4)
2. 5 YR. Payback Calculations (Worksheet on pages 2 & 3 or other documented method)
3. Drawings and Pictures depicting the conditions.
4. Documentation of Unit Fuel Cost (Fuel billing less than 6 months old)
5. Cost Estimate of the Conservation Measures (signed by contractor)
6. \$10 Application Fee.
7. Send to DILHR, Rental Unit Energy Efficiency Exemptions, P. O. Box 7969, Madison, WI 53707.

The Department will determine eligibility for an exemption in accordance with ILHR 67.06 of the Wisconsin Administrative Code. Upon determination of eligibility, the office will issue a letter of exemption which must be presented to the inspector performing the compliance inspection.

A) This exemption is being applied for: (Please check only one of the following)

Table reprinted from How to Figure Heat Loss & Fuel Cost by D. S. Smith, T. J. Steinhilber and L. A. Frank.

U^m is a designation for thermal transmittance and stands for an overall coefficient of heat transfer. It compares to thermal resistance (R) by the inverse relationship: $U^m = 1/R^m$ or the transmittance is equal to the inverse of the resistance. The resistance of any one element is the sum of all the resistances in the path of the heat flow.

Energy savings is proportional to the change in the U^m (ΔU^m) multiplied by the area of the building element being considered. Following are three ways of determining the product ΔU^m (direct then are specific to particular building elements. There is a section for determining the ΔU^m for ceilings, a section for determining the ΔU^m for walls, for gills and floors, and a section for determining the ΔU^m for foundations. Select the section that is appropriate for the element you are performing the analysis on.

The energy savings calculation used in the enclosed worksheet conforms to the method described in Chapter ILHR 67. The following equation is a summary of the calculation. References are made below the equation to the parts of this form which correspond to the equation.

$$ES = (\text{Degree Days}) \times \left(\frac{1}{R_1} - \frac{1}{R_2} \right) \times (A \times X) \quad \begin{matrix} \text{ES = Annual Energy Savings (in units of fuel)} \\ X = Heating Efficiency Factor \\ V = Heating Value of Fuel (per unit) \\ \text{ALL FACTORS ARE SPECIFIED BY ILHR 67.06.} \end{matrix}$$
