#### DEPARTMENT OF NATURAL RESOURCES

### Chapter NR 219

#### **ANALYTICAL TEST METHODS AND PROCEDURES**

| NR 219.01 | Purpose.       | NR 219.04 | Identification of test procedures.        |
|-----------|----------------|-----------|---|
| NR 219.02 | Applicability. | NR 219.05 | Alternate test procedures.                |
| NR 219.03 | Definitions.   | NR 219.06 | Laboratory certification or registration. |

**Note:** A number of the references cited in this chapter are no longer in print. Copies of references which are out–of–print are available at any public library by inter–library loan.

**NR 219.01 Purpose.** The purpose of this chapter is to establish analytical test methods, preservation procedures, requirements for laboratories, and procedures applicable to effluent limitations for discharges from point sources as authorized by ss. 299.11 and 283.55 (1), Stats.

History: Cr. Register, August, 1976, No. 248, eff. 9–1–76; am. Register, April, 1986, No. 364, eff. 8–28–86; am. Register, June, 1986, No. 366, eff. 7–1–86; am. Register, April, 1988, No. 388, eff. 5–1–88; corrections made under s. 13.93, (2m) (b) 7., Stats., Register, November, 1996, No. 491.

- **NR 219.02 Applicability. (1)** The procedures prescribed herein shall, except as provided in s. NR 219.06, be used in the determination of concentrations and quantities of pollutant parameters as required for:
- (a) An application submitted to the department for a permit under ch. 283, Stats.
- (b) Reports required to be submitted by dischargers in accordance with the conditions of issued permits.
- **(2)** Section NR 219.07 requires that laboratories conducting tests under this chapter be certified, registered, or approved under ch. NR 149, HFS 157 or HSS 165.

**History:** Cr. Register, August, 1976, No. 248, eff. 9–1–76; am. Register, April, 1986, No. 364, eff. 8–28–86; am. (1) (intro.), Register, June, 1986, No. 366, eff. 7–1–86; correction in (1) (a) made under s. 13.93 (2m) (b) 7., Stats., Register, Lyosenber, 1996, No. 491; **correction in (2) made under s. 13.93 (2m) (b) 7., Stats.** 

#### **NR 219.03 Definitions.** As used in this chapter:

- (1) "EPA" means the U.S. environmental protection agency.
- (2) "Department" means the department of natural resources. History: Cr. Register, August, 1976, No. 248, eff. 9–1–76; am. (1), (2), (3) and (4m), Register, January, 1978, No. 265, eff. 2–1–78; r. and recr. Register, June, 1986, No. 366, eff. 7–1–86; r. and recr. (1), r. (3) and (4), Register, November, 1992, No. 443, eff. 12–1–92.

#### NR 219.04 Identification of test procedures.

(1) ANALYTICAL TEST PROCEDURES. Parameters or pollutants, for which wastewater analytical methods are approved, are listed together with test procedure descriptions and references in tables A to E. Parameters or pollutants, for which sludge analytical methods are approved, are listed together with test procedure

descriptions and references in table EM. Metals samples digestion procedures and references are listed in table BM. The discharge values for the listed parameters shall be determined by one of the standard analytical test procedures identified in a table under this subsection or by an alternate test procedure established under ss. NR 219.05 and 149.12.

- (2) Sample preservation procedures. Sample preservation techniques, container materials, and maximum allowable holding times for parameters identified in tables A to E are prescribed in table F. Sludge samples shall be preserved at the time of collection by cooling to 4° C where required. All samples requiring preservation at 4° C shall be cooled immediately after collection, and the required temperature maintained during shipping. Any person may apply for a variance from the prescribed preservation procedures applicable to samples taken from a specific discharge. Applications for variances may be made by letters to the regional administrator and shall provide sufficient data to assure that the variance does not adversely affect the integrity of the sample. The regional administrator will make a decision on whether to approve or deny a variance within 90 days of receipt of the application.
- (3) TEMPERATURE REPORTING PROCEDURES. Samples cooled with ice packs or not in direct contact with ice during shipping shall be cooled to 4° C prior to shipping, and a temperature blank shall be submitted with the samples. Samples cooled during shipping with ice packs may not be recorded as received on ice. Samples may be recorded as received on ice only if solid ice is present in the cooler at the time the samples are received. If the samples are not received on ice, the laboratory shall record one of the following at the time of receipt:
  - (a) The temperature of an actual sample.
- (b) The temperature of a temperature blank shipped with the samples.
- (c) The temperature of the melt water in the shipping container. **Note:** Copies of the publications referenced in Tables A F are available for inspection at the offices of the department of natural resources, the secretary of state and the revisor of statutes. Many of these materials are also available through inter–library loan.

**History:** Cr. Register, June, 1986, No. 366, eff. 7–1–86; r. and recr. Tables B and E, Register, April, 1988, No. 388, eff. 5–1–88; am.; r. and recr. Tables A to F, Register, November, 1992, No. 443, eff. 12–1–92; am. (1), am. Tables A to F, Register, April, 1994, No. 460, eff. 5–1–94; am. (1) and (2), Tables A to F, cr. (3), Register, February, 1996, No. 482, eff. 3–1–96.

- <sup>6</sup> A digestion procedure is required to solubilize suspended material and to destroy possible organic metal complexes. The required digestion procedure(s) for a particular metals analysis is listed in Table BM, Metals Digestion Procedures. Use of the graphite furnace AA technique, inductively coupled plasma, direct current plasma, as well as determination for certain elements such as arsenic, mercury, selenium, silver, and titanium require a modified digestion procedure. In all cases, the analytical method should be consulted for specific instructions and cautions.
  - If a digestion procedure is given in the determinative method for any of the metals in table B, and this digestion is not listed in table BM, the procedure given in the analytical method should be used however if the digestion included in one of the approved non–EPA references (e.g. "Standard Methods for the Examination of Water and Wastewater") is significantly different from one of the EPA procedures listed in table BM, than the EPA procedure from table BM should be used.

Sample digestion may be omitted for AA (direct aspiration or graphite furnace), direct current plasma, and inductively coupled plasma analyses provided the sample solution to be analyzed meets the following criteria:

- (a) has a low COD (<20),
- (b) is visibly transparent with a turbidity measurement of 1 NTU or less,
- (c) is colorless with no perceptible odor, and
- (d) is of one liquid phase and free of particulate or suspended matter following acidification.
- <sup>6m</sup> Either of the following microwave digestion procedures may be used:

Available on inter–library loan.
- <sup>13</sup> The use of normal and differential pulse voltage ramps to increase sensitivity and resolution is acceptable.
- $^{14}$  Carbonaceous biochemical oxygen demand (CBOD<sub>5</sub>) must not be confused with the traditional BOD<sub>5</sub> test which measures "total BOD<sub>5</sub>." The addition of the nitrification inhibitor is not a procedural option, but must be included to report the CBOD<sub>5</sub> parameter. A discharger whose permit requires reporting the traditional BOD<sub>5</sub> may not use a nitrification inhibitor in the procedure for reporting the results. Only when a discharger's permit specifically states CBOD<sub>5</sub> is required, can the permittee report data obtained using the nitrification inhibitor.

- <sup>29</sup> The approved method is that cited in "Standard Methods for the Examination of Water and Wastewater", 14th Edition. The colorimetric reaction is conducted at a pH of 10.0 + 0.2. The approved methods are given on pp. 576–81 of the 14th Edition: Method 510A for distillation, Method 510B for the manual colorimetric procedure, or Method 510C for the manual spectrophotometric procedure. Available on inter–library loan.
- 30 "Direct Determination of Elemental Phosphorus by Gas-Liquid Chromatography", by R. F. Addison and R. G. Ackman, Journal of Chromatography, Volume 47, No. 3, pp. 421–426, 1970. Available in most public libraries. Back volumes of the Journal of Chromatography are available from Elsevier/North-Holland, Inc., Journal Information Centre, 52 Vanderbilt Avenue, New York, NY 10164.
- <sup>31</sup> Approved methods for the analysis of silver in industrial wastewaters at concentrations of 1 mg/L and above are inadequate where silver exists as an inorganic halide. Silver halides such as the bromide and chloride are relatively insoluble in reagents such as nitric acid but are readily soluble in an aqueous buffer of sodium thiosulfate and sodium hydroxide to a pH of 12. Therefore, for levels of silver above 1 mg/L, 20 mL of sample should be diluted to 100 mL by adding 40 mL each of 2M Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and 2M NaOH. Standards should be prepared in the same manner. For levels of silver below 1 mg/L the approved method is satisfactory.

Available from the Superintendent of Documents, U.S. Government Printing Office, Washington DC 20402, (202) 512–1800.

<sup>&</sup>lt;sup>2</sup>"Methods for the Determination of Metals in Environmental Samples", EPA–600/4–91–010, Environmental Protection Agency, Environmental Monitoring Systems Laboratory, Cincinnati, OH 45268, June 1991. Available from the National Technical Information Service (NTIS), order number PB91–231498, 5258 Port Royal Road, Springfield, Virginia 22161, (703) 487–4650.

- <sup>3</sup>"Methods for Chemical Analysis of water and Wastes", EPA-600/4-79-020, United States Environmental Protection Agency, Revised March 1983 and 1979 where applicable. Available from National Technical Information Service, 5285 Port Royal Road, Springfield, Virginia 22161 (703) 487–4650.
- 4"Dissolved metals" means those constituents of a sample that will pass through a 0.45 micron membrane filter prior to sample acidification.
- 5"Suspended metals" means the concentration of metals determined in the portion of a sample retained by a 0.45 micron membrane filter prior to acidification.
- 6"Total metals" means the concentration of metals determined on a solid sample or unfiltered aqueous sample following a vigorous digestion, or alternatively the sum of the metals determined in both the dissolved and suspended fractions.
- 7"Total recoverable metals" means the concentration of metals determined on an unfiltered sample following treatment with hot dilute mineral acid.
- 8"Acid soluble metals" means those constituents of a sample that will pass through a 0.45 micron membrane filter after the sample has been adjusted to pH 1.75 and held for 16 hours. This method is applicable to arsenic, cadmium, chromium, copper, and lead.
- <sup>9</sup>"Available metals" are equivalent to "total metals". SW-846 lists method 3015 as a preparation for available metals.
- <sup>10</sup> These methods are for total metals analysis of sediment, sludge, and soil samples and do not apply to wastewater. The required analytical methodology for metals in wastewater sludge is given in Table EM.
- <sup>11</sup>Method 3020 is applicable for analysis by GFAA. Method 3010 requires sample acidification with HCl.
- <sup>12</sup>Method 200.1 is only applicable for As, Cd, Cr, Cu and Pb.
- <sup>13</sup>This method is a microwave–assisted acid leachate digestion.

<sup>1&</sup>quot;The full text of Methods 601-613, 624, 625, 1624, and 1625, are given in Appendix A of 40 CFR part 136," Test Procedures for Analysis of Organic Pollutants". The standardized test procedure to be used to determine the method detection limit (MDL) for these procedures is given in Appendix B of 40 CFR part 136, "Definition and Procedure for the Determination of the Method Detection Limit." Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

<sup>&</sup>lt;sup>2</sup>"Methods for Benzidine, Chlorinated Organic Compounds, Pentachlorophenol and Pesticides in Water and Wastewater," Environmental Monitoring and Support Laboratory, United States Environmental Protection Agency, Cincinnati, Ohio 1978. Available from: ORD Publications, CERI, U.S. Environmental Protection Agency, 26 W. St. Claire, Cincinnati, Ohio 45268.

<sup>&</sup>lt;sup>3</sup>Method 624 may be extended to screen samples for Acrolein and Acrylonitrile. However, when they are known to be present, the preferred method for these two compounds is Method 603 or Method 1624.

<sup>&</sup>lt;sup>4</sup>Method 625 may be extended to include benzidine, hexachlorocyclopentadiene, N-nitrosodimethylamine, and N-nitrosodiphenylamine. However, when they are known to be present, Methods 605, 607, and 612, or Method 1625, are preferred methods for these compounds.

<sup>5&</sup>quot;Selected Analytical Methods approved and Cited by the United States Environmental Protection Agency," Supplement to the 15th Edition of "Standard Methods for the Examination of Water and Wastewater" (1981). Available from: American Public Health Association, 1015 Fifteenth Street, N.W., Washington, D.C. 20036.

<sup>&</sup>lt;sup>6</sup>Each analyst must make an initial, one-time, demonstration of their ability to generate acceptable precision and accuracy with Methods 601-613, 624, 625, 1613A, 1624, and 1625 in accordance with procedures in section 8.2 of each of these Methods. Additionally, each laboratory, on an on-going basis must spike and analyze 10% (5% for Methods 624 and 625 and 100% for Methods 1624 and 1625) of all samples to monitor and evaluate laboratory data quality in accordance with sections 8.3 and 8.4 of these Methods. When the recovery of any parameter falls outside the warning limits, the analytical results for that parameter in the unspiked sample are suspect and cannot be reported to demonstrate regulatory compliance.

<sup>&</sup>lt;sup>7</sup>Method 1613 Revision A: Tetra- through Octa- Chlorinated Dioxins and Furans by Isotope Dilution, HRGC/HRMS, Environmental Protection Agency, Federal Register, page 5098, February 1991. Available from the Superintendent of Documents, US Government Printing Office, Washington, D.C. 20402.

<sup>8&</sup>quot;Standard Methods for the Examination of Water and Wastewater", Joint Editorial Board, American Public Health Association, American Water Works Association, and Water Pollution Control Federation, 18th Edition, 1992. Available from American Public Health Association, 1015 Fifteenth Street, N.W., Washington, D.C. 20005.

<sup>&</sup>lt;sup>12</sup>SW-846 methods 8021, 8061, 8081, and 8121 require one of the following sample preparation (extraction/clean-up) procedures: 3500/3510 (liquid-liquid extraction), 3500/3520 (continuous liquid-liquid extraction), or 5030 (purge and trap method). The required sample preparation procedure is given in the determinative procedure. Method 8021 requires 5030 (purge and trap). Methods 8081 and 8121 require either 3500/3510 or 3500/3520 in addition to 3600. Method 8061 requires 3510. For methods 8021, 8061, 8081, and 8121 see also SW-846 method 8000A.

<sup>&</sup>lt;sup>13</sup>The 18th edition of "Standard Methods for the Examination of Water and Wastewater" is not significantly different from the 17th edition. The 17th edition remains an acceptable reference for those methods which cite the 18th edition.

<sup>&</sup>lt;sup>14</sup>In order to reference these methods, the laboratory must use a packed column for the GC separations.

| 70. | Trifluralin            | GC<br>GC/MS |                          | 8080A<br>8080A | 8081<br>8270B      | 6630 B                 |                         | Note 3, p.7                 |

A"Test Methods for Evaluating Solid Waste", 3rd Edition. SW–846, Office of Solid Waste and Emergency Response, Environmental Protection Agency, November 1986, including December 1987, July 1992, August 1993, September 1994 and January 1995 updates, Washington DC 20460. Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, (202) 512–1800.

B"Standard Methods for the Examination of Water and Wastewater", 18th Edition, Joint Editorial Board, American Public Health Association, American Water Works Association, and Water Pollution Control Federation, 1015 Fifteenth Street, N.W., Washington, D.C. 20005, 1992. Available from American Public Health Association, 1015 Fifteenth Street, N.W., Washington, D.C. 20005.

C"Annual Book of Standards—Water and Environmental Technology", Section 11, Parts 11.01 and 11.02, American Society for Testing and Materials, 1993. Available from the American Society for Testing and Materials, 1916 Race Street, Philadelphia, PA 19103.

<sup>&</sup>lt;sup>1</sup>Pesticides are listed in this table by common name for the convenience of the reader. Additional pesticides may be found under Table D, where entries are listed by chemical name and type.

<sup>&</sup>lt;sup>2</sup>The full text of methods 608 and 625 are given in Appendix A of the Federal Register, October 26, 1984 (Part VIII, 40 CFR part 136), "Test Procedure for Analysis of Organic Pollutants". The standardized test procedure to be used to determine the method detection limit (MDL) for these test procedures is given in Appendix B of 40 CFR part 136, "Definition and Procedure for the Determination of the Method Detection Limit". Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

<sup>3&</sup>quot;Methods for Benzidine, Chlorinated Organic Compounds, Pentachlorophenol and Pesticides in Water and Wastewater". U.S. Environmental Protection Agency, September, 1978. This EPA publication includes thin–layer chromatography (TLC) methods. Available from: ORD Publications, CERI, U.S. Environmental Protection Agency, 26 W. St. Claire, Cincinnati, Ohio 45268.

<sup>4&</sup>quot;Methods for Analysis of Organic Substances in Water", Book 5, Chapter A3, 1987. Available from: U.S. Geological Survey, 604 S. Pickett Street, Alexandria, VA 22304.

<sup>&</sup>lt;sup>5</sup>The method may be extended to include a(alpha)–BHC, d(delta)–BHC, endosulfan I, endosulfan II, and endrin. However, when they are known to exist, Method 608 is the preferred method.

<sup>6&</sup>quot;Selected Analytical Methods Approved and Cited by the United States Environmental Protection Agency," Supplement to the Fifteenth Edition of "Standard Methods for Examination of Water and Wastewater" (1981). Available from: American Public Health Association, 1015 15th St., N.W., Washington, D.C. 20005.

<sup>&</sup>lt;sup>7</sup>Each analyst must make an initial, one–time demonstration of their ability to generate acceptable precision and accuracy with Methods 608 and 625 (See Appendix A in 40 CFR part 136) in accordance with procedures given in Section 8.2 of each of these methods. Additionally, each laboratory, on an on–going basis, must spike and analyze 10% of all samples analyzed with Method 608 or 5% of all samples analyzed with Method 625 to monitor and evaluate laboratory data quality in accordance with Sections 8.3 and 8.4 of these methods. When the recovery of any parameter falls outside the warning limits, the analytical results for that parameter in the unspiked sample are suspect and cannot be reported to demonstrate regulatory compliance. Available from the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402.

<sup>&</sup>lt;sup>8</sup>Some of these methods require a preliminary extraction. Methods 8141 A and 8081 require the use of either SW–846 method 3500/3510 or 3500/3520. Methods 8151 and 8270 B include the extraction steps necessary for most compounds. For methods 8081, 8141, and 8151 see also SW–846 method 8000 A and 3600.

<sup>&</sup>lt;sup>9</sup>The 18th edition of "Standard Methods for the Examination of Water and Wastewater" is not significantly different from the 17th edition. The 17th edition remains an acceptable reference for those methods which cite the 18th edition.

<sup>&</sup>lt;sup>10</sup>HPLC method 623 from "Methods for Nonconventional Pesticides Chemicals Analysis of Industrial and Municipal Wastewater", EPA 440/1–83/079– C, United States Environmental Protection Agency. Available from National Technical Information Service, 5258 Port Royal Road, Springfield, Virginia, 22161 (703) 487–4650.

<sup>&</sup>lt;sup>11</sup>In order to reference these methods, the laboratory must use a packed column for the GC separations.

Table E List of Approved Radiological Test Procedures For Wastewater

| Pai | rameter and Units                   | Method                                | EPA <sup>1</sup> | Standard<br>Methods <sup>2</sup> | ASTM <sup>3</sup> | USGS <sup>4</sup>          |
|-----|-------------------------------------|---------------------------------------|------------------|----------------------------------|-------------------|----------------------------|
| 1.  | Alph-Total, pCi per liter           | Proportional or Scintillation Counter | 900.0            | 7110 B                           | D1943-90          | pp. 75 and 78 <sup>5</sup> |
| 2.  | Alpha–Counting error, pCi per liter | Proportional or Scintillation Counter | Appendix B       | 7110 B                           | D1943-90          | p. 79                      |
| 3.  | Beta-Total, pCi per liter           | Proportional Counter                  | 900.0            | 7110 B                           | D1890-90          | pp. 75 and $78^{5}$        |
| 4.  | Beta-Counting error, pCi            | Proportional Counter                  | Appendix B       | 7110 B                           | D1890-90          | p. 79                      |
| 5.  | (a) Radium-Total                    | Proportional Counter                  | 903.0            | 7500Ra B                         | D2460-90          |                            |
|     | (b) 226Ra, pCi per liter            | Scintillation Counter                 | 903.1            | 7500Ra C                         | D3454-7991        | p. 81                      |

<sup>&</sup>lt;sup>1</sup> "Prescribed Procedures for Measurement of Radioactivity in Drinking Water," EPA-600/-4-80-032, U.S. Environmental Protection Agency, August 1980.

<sup>&</sup>lt;sup>5</sup> The method found on p. 75 measures only the dissolved portion while the method on p. 78 measures only the suspended portion. Therefore, the two results must be added to obtain the "total".

<sup>&</sup>lt;sup>1</sup>Polyethylene (P) or Glass (G). For microbiology, plastic sample containers must be made of sterilizable materials (polypropylene or other autoclavable plastic)

<sup>&</sup>lt;sup>2</sup>All samples requiring preservation at 4°C must be cooled immediately after collection, and the temperature of the samples shall be documented upon receipt at the laboratory. If the samples are shipped in crushed or cube ice (not "blue ice" packs) and solid ice is still present in the cooler, the lab may simply report the samples as "received on ice". If the ice has melted, the lab must report the either the temperature of the meltwater or of a temperature blank. A temperature blank is defined as an aliquot of deionized water, in an appropriate sample container, which is transported along with the samples. If sampling teams use "blue ice" packs, it is necessary to pre-chill all sample containers to at least 4 degrees celsius with ice or refrigeration prior to shipping. Since shipping simply with "blue ice" packs does not insure that samples are maintained at the appropriate temperatures, the sample collector must submit a temperature blank when using these ice packs for shipping. For composite chemical samples each aliquot should be preserved at the time of collection. When use of an automated sampler makes it impossible to preserve each aliquot, then chemical samples may be preserved by maintaining at 4°C until compositing and sample splitting are completed.

<sup>&</sup>lt;sup>3</sup>When any sample is to be shipped by common carrier or sent through the United States mail, it must comply with the Department of Transportation Hazardous Materials Regulations (49 CFR Part 172). The person offering such material for transportation is responsible for ensuring such compliance. For the preservation requirements of Table J, the Office of Hazardous Materials, Materials Transportation Bureau, Department of Transportation has determined that the Hazardous Materials Regulations do not apply to the following materials: Hydrochloric acid (HCl) in water solutions at concentrations of 0.04% by weight or less (pH about 1.96 or greater); Nitric acid (HNO<sub>3</sub>) in water solutions at concentrations of 0.15% by weight or less (pH about 1.62 or greater); Sulfuric acid (H<sub>2</sub>SO<sub>4</sub>) in water solutions at concentrations of 0.35% by weight or less (pH about 1.15 or greater); and Sodium hydroxide (NaOH) in water solutions at concentrations of 0.080% by weight or less (pH about 12.30 or less).

<sup>&</sup>lt;sup>4</sup>Samples should be analyzed as soon as possible after collection. The times listed are the maximum times that samples may be held before analysis and still be considered valid. Virus samples can be stored indefinitely at –70°C. Samples used for toxicity tests are to be used for test initiation or for renewal of test solutions within 36 hours of collection as grab samples or after removal from composite samplers. For other composite samples, the holding time commences immediately after the samples are removed from the composite sampler. The time the sample spends in the sampler during collection does not count towards the maximum holding time. Samples for biological or chemical analysis may be held for longer periods than specified in this table only if the permittee or monitoring laboratory, has data on file to show that the specific types of samples under study are stable for the longer time, and has received a variance from the Regional Administrator (s. NR 219.05). Some samples may not be stable for the maximum time period given in the table. A permittee or monitoring laboratory is obligated to hold the sample for a shorter time if knowledge exists to show that this is necessary to maintain sample stability.

<sup>&</sup>lt;sup>5</sup>Should only be used in the presence of residual chlorine.

<sup>&</sup>lt;sup>6</sup>Maximum holding time is 24 hours when sulfide is present. Optionally all samples may be tested with lead acetate paper before pH adjustments in order to determine if sulfide is present. If sulfide is present it can be removed by the addition of cadmium nitrate powder until a negative spot test is obtained. The sample is filtered and then NaOH is added to pH 12.

<sup>&</sup>lt;sup>7</sup>Samples should be filtered immediately on–site before adding preservative for dissolved metals.

<sup>&</sup>lt;sup>8</sup>Guidance applies to samples to be analyzed by GC, LC, or GC/MS for specific compounds.

<sup>&</sup>lt;sup>9</sup>Samples receiving no pH adjustment must be analyzed within seven days of sampling.

<sup>&</sup>lt;sup>10</sup>The pH adjustment is not required if acrolein will not be measured. Samples for acrolein receiving no pH adjustment must be analyzed within 3 days of sampling.

<sup>&</sup>lt;sup>11</sup>When the extractable analytes of concern fall within a single chemical category, the specified preservation and maximum holding times should be observed for optimum safeguard of sample integrity. When the analytes of concern fall within two or more chemical categories, the sample may be preserved by cooling to 4°C, reducing residual chlorine with 0.008% sodium thiosulfate, storing in the dark, and adjusting the pH to 6–9; samples preserved in this manner may be held for seven days before extraction and for forty days after extraction. Exceptions to this optional preservation and holding time procedure are noted in footnote 5 (re the requirement for thiosulfate reduction of residual chlorine), and footnotes 12, 13 (re the analysis of benzidine).

<sup>&</sup>lt;sup>12</sup>If 1,2-diphenylhydrazine is likely to be present, adjust the pH of the sample to 4.0 + 0.2 to prevent rearrangement to benzidine.

<sup>&</sup>lt;sup>13</sup>Extracts may be stored up to 7 days before analysis if storage is conducted under an inert (oxidant–free) atmosphere.

<sup>14</sup>For the analysis of diphenylnitrosamine, add 0.008% Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and adjust pH to 7–10 with NaOH within 24 hours of sampling.
 <sup>15</sup>The pH adjustment may be performed upon receipt at the laboratory and may be omitted if the samples are extracted within 72 hours of collection. For the analysis of aldrin, add 0.008% Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub>.

NR 219.05 Alternate test procedures. Approvals of alternate test procedures for nationwide use and specific discharges are granted by EPA. The department may approve the use of an alternate test procedure on a case—by—case basis if the criteria for approval of the alternate procedure established in s. NR 149.12 are met. If the department or the EPA approves an alternate test procedure, it shall be considered equivalent to the approved method.

Note: The federal requirements for alternate test procedure approval are given in 40 CFR 136.5.

**History:** Cr. Register, August, 1976, No. 248, eff. 9–1–76; r. and recr. January, 1978, No. 265, eff. 2–1–78; renum. from NR 219.04 and am. Register, June, 1986, No. 366, eff. 7–1–86; r. and recr. Register, November, 1992, No. 443, eff. 12–1–92; am. Register, February, 1996, No. 482, eff. 3–1–96.

# NR 219.06 Laboratory certification or registration. Bacteriological analyses of groundwater samples, and all radiological analyses shall be performed by the state laboratory of hygiene or at a laboratory certified or approved by the department

of health and social services. Other laboratory test results, including effluent toxicity, submitted to the department under a WPDES permit shall be performed by a laboratory certified or registered under ch. NR 149. The following tests are excluded from this requirement:

- (1) Temperature,
- (2) Turbidity,
- (3) Bacteria tests in wastewater effluent and sludges,
- (4) pH,
- (5) Chlorine residual,
- (6) Specific conductance,
- (7) Physical properties of soils and sludges,
- (8) Nutrient tests of soils and sludges,
- (9) Flow measurements.

**History:** Cr. Register, April, 1986, No. 364, eff. 8–28–86; renum. from NR 219.07 and am. (intro.) Register, November, 1992, No. 443, eff. 7–1–93; am. Register February, 1996, No. 482, eff. 3–1–96.
