A 34.17 (1) BALANCED LOAD TEST. The anthropometric data presented in reference 1 indicates correlation between hip width and body weight. Assuming that the hip width determines the number of persons that can occupy an amusement ride passenger space, the total weight can be estimated from hip width vs. body weight data if the dimensions of the space are known.

Figure 1 represents a conservative estimate of hip width vs. body weight for the American public. This data should be used to determine the weight to be placed in each passenger space when an amusement ride is load tested in accordance with s. Comm 34.17.

Example of the use of this data:

Rated capacity of space	3 adults
Hip space	46 inches
Hip space per person	$\frac{46}{3} = 15.33$ inches
Corresponding body weight	187 pounds (see Figure 1)
Total load weight = 3×1	$187 \times 1.75 = 981.75$
